

Transforming telemedicine

For years, patients with pacemakers relied on traditional, stationary home monitors placed by their bedside to transmit cardiac data to clinics for evaluation. This cumbersome, time-consuming process often delayed critical, proactive interventions against sudden arrhythmias and acute cardiac events.

To streamline this pathway, medical technology pioneer Medtronic developed the MyCareLink Heart™ mobile application. This innovation communicates securely and directly with smartphone-connected pacemakers to seamlessly aggregate and track vital patient data, including heart rate, blood pressure, and weight.

If specific metrics warrant clinical attention, the app automatically alerts the patient's physicians, enabling rapid review and early therapeutic intervention.

"For the first time, pacemakers can communicate securely and directly with technology that patients use every day, like smartphones and tablets." — Aisha Barry, Vice President & General Manager, Medtronic

This breakthrough earned widespread clinical acclaim, being named the top smartphone-connected pacemaker solution by the Cleveland Clinic and ranking third overall on their prestigious Top 10 Medical Innovations list.

Key Application Features

- **My Heart Device:** Displays real-time battery longevity, implant date, device name, serial number, and clinic contact information.
 - **My Vitals Tracking:** Logs and archives physiological measurements—such as weight, blood pressure, and heart rate—to track health trends over time.
 - **Physical Activity:** Generates daily, weekly, and monthly physical activity dashboards utilizing telemetry directly from the heart device.
 - **My Transmissions:** Provides a transparent historical log of data transmissions sent from the pacemaker to the supervising clinic.
 - **My Symptom Journal:** Creates a localized digital diary of symptoms for patients to easily reference during in-office doctor visits.
 - **Education:** Offers an integrated library of educational resources regarding optimal living with an implanted cardiac device.
- ✓ **Connectivity Status** A green check mark confirms that the smartphone settings are correctly optimized for the cardiac device to successfully link to the app.
